HW 8: Final Project

In my final project proposal, I said I would implement 5 new features into my social network. The 5 features were a default profile picture, a default bio, an editable bio, a back button and some UI updates. I implemented all of these features with some changes from my project proposal.

I was able to implement a default profile picture by looking up online at a blank profile picture. I took that and stored it into my folder. After that I created a variable in user.cpp and stored it into a default user. Once I did that, I added everything I needed into QT and in the UI you could see the default profile picture. This is exactly what I said I would do in my project proposal and I followed every step.

For the default bio, I implemented it in the same exact way as the default profile picture. Instead of using a photo, I used the string "Welcome to my profile" and created a new variable for the User. So every time you login, at the top you will see that exact text. In my project proposal, I followed the proposal exactly as I said and it worked.

For the editable bio, I first had to create a new window .h and .cpp file. So whenever someone wants to edit their bio, they can click the button, "view full profile", and it will open up a new window that shows their full bio. They can then click on the edit bio button to change their bio. Once they make their changes, a save button will appear. Once they click that, their bio will be updated and once they exit out of the window, their new bio will be visible for everyone to see. When you go onto someone else's profile, you will be able to see their full profile but you cannot edit it. I made some changes from the original project proposal, because when I tried to add the bio into users.txt, it would overwrite the original txt file and get rid of all of the other users. I left the change temporary, so that the other users will still be in the file. Also once you hit the red x at the top right, I added in the line Qt::WA_DeleteOnClose, which automatically deletes the widget and updates the bio. I also used the destroyed functionality which updates the mainwindow when you are done with the profilewindow <https://stackoverflow.com/questions/32477930/qtwa-deleteonclose> <https://doc.qt.io/qt-6/qobject.html#destroyed>

I implemented the back button in the second window. Whenever you are done changing your bio, you can hit the back button that puts you back into the main window. Instead of clicking the red x, you hit the back button and you are back in the main window with your updated bio. I was able to follow this on my project proposal.

For the UI implementations, I changed the colors of the buttons to green, changed the background color to a light pink and changed the font as well. I didn't specifically say what I would change in my project proposal, but I still made the changes.
